The filter should control the fluid cleanliness to a level that is equal to the performance, life and reliability of the system required by the user. It should allow fluid to pass through at the given flow with the minimum pressure drop (DP) to minimize stress and energy losses.

The pore size is the size of the tiny holes in a filter that let water through. Think of a strainer or colander: The smaller the pores, the smaller the contaminants they keep out. If a filter has an “absolute” pore size of 1 micron, for example, each and every one of the filter’s pores is 1 micron or smaller.
