Otherwise we continue the process. The process must end because  $G$  is finite, so  $G$  contains a cycle. (a) implies (b): Since  $T$  is connected and contains no cycles, the claim implies that there exists a vertex of degree 1 in  $T$ . We delete this vertex and the attached edge from  $T$ , and the remaining object  $T$  is still a connected graph with no ...

Conditional Poisson processes don't have independent increments, which means they're not Poisson process. But given  $(N(t) = n)$  the arrival times are distributed as the order statistics from a set of  $(n)$  independent uniform  $((0,t))$  random variables. Refer the solution for Problem 2.41 in textbook for detail.

Stochastic Processes. Stochastic Processes (MATH136/STAT219, Winter 2020) This course prepares students to a rigorous study of Stochastic Differential Equations, as done in Math236. Towards this goal, we cover -- at a very fast pace -- elements from the material of the (Ph.D. level) Stat310/Math230 sequence, emphasizing the applications to stochastic processes, instead of detailing proofs of theorems.

The book is a combination of the material from two MIT courses: (6.262) Discrete Stochastic Process and (6.432) Stochastic Processes, Detection, and Estimation. Because of this, the book shares much in common with Prof. Gallager's previous textbook: Discrete Stochastic Processes (ISBN-13: 978-0792395836 published 1995).
