how the process works.

## **Ph Properties Of Buffer Solutions**

A buffer solution is an aqueous solution consisting of a mixture of a weak acid and its conjugate base, or vice versa. Its pH changes very little when a small amount of strong acid or base is added to it. Buffer solutions are used as a means of keeping pH at a nearly constant value in a

## **Specific pH ...**

Buffers are defined as solutions which resist small change in pH by adding small amount of acid or base. A buffer usually consists of a weak acid and its salt (for eg, acetic acid and sodium acetate) or a weak base and its salt (for eg, ammonium hydroxide and ammonium chloride).

Mechanism of buffer action:  $\text{CH}_3\text{COOH}$

## **Buf ...**

Buffers resist changes in pH when acids or bases are added to them. An effective buffer system contains significant quantities of a specific weak acid and its conjugate base. There are two common methods used to prepared a buffer. One method is to combine approximately equal quantities of an acid and its conjugate base.
