Secant Pile Wall Design Manual

The secant pile wall is designed to resist the lateral earth pressure due to the retained backfill. Moreover, in certain cases the piles may have to function as foundation at a later stage. In such cases the piles have to be designed to resist the vertical axial loads as well.

The boring process for the secondary pile shall only commence upon initial set of the primary piles. A secant wall is made up of several steps: 1. The initial step is to construct a guide wall to set up the positioning of the secant pile wall. 2. Drill and Installation of the 1 meter temporary casing. 3. Drilling of the Primary Columns, 1,3,5,7, etc etc. 4. Concreting of Primary Columns.

The shoring wall design is based on 3.28 ft (1 m) diameter secant piles installed at either 2.25 ft (690 mm) or 2.0 ft (610 mm) center-to-center spacing, depending upon the depth to bedrock. The design assumes that a verticality tolerance of 0.5% is achievable.

Secant pile walls are created by drilling or augering a series of overlapping concrete piles reinforced with steel beams or rebar to form a wall. After the initial piles are installed and gain sufficient strength, the secondary piles are installed in between the initial piles to create a continuous and impervious wall.

Chapter 8 Walls and Buried Structures

Project Description A Secant Piled Wall is a retaining wall constructed for ground retention prior to excavation. The wall is formed by constructing alternating primary (female) and secondary (male) piles where the secondary piles partially cut into either side of the primary piles in order to form a continuous impervious structure.

In this example we will design a 12.53m deep circular shaft excavation formed by unreinforced secant piles. Tables 1 and 2 present the soil properties and the stratigraphy respectively. Table 3 presents the external loads. Table 4 presents the wall properties. The general ground elevation is 4.43 m and the general water elevation is 3 m.

Secant pile walls are formed by constructing intersecting reinforced concrete piles. The piles are reinforced with either steel rebar or with steel beams and are constructed by drilling under mud. Primary piles are installed first with secondary piles constructed in between primary piles once the latter gain sufficient strength.

Secant pile walls are particularly suitable for excavations close to buildings, roads, and other sensitive structures. These retaining walls are formed by a series of interlocking drilled shafts and can be used where high water tables and/or unstable ground conditions occur. Secant walls are installed by high torque fixed mast rigs.

Secant Pile Walls Construction Methodology Secant pile walls are an extremely effective type of embedded or in-ground retaining wall. They are formed with intersecting piles of concrete forming a continuous structure. Secant walls hold soil and rock back, even in unstable soil conditions, while preventing water flow into the excavation area.
