Signal integrity becomes more important in electronic design as circuit speeds increase. Faster data rates and shorter rise/fall times make it more challenging to transmit a signal from point A to point B. Signal distortion and degradation simultaneously have adverse effects on electromagnetic compatibility.

In the high-speed connector design arena, there are two opposing ideas. For some people, if you simply put pieces of plastic and metal together, eventually you have a signal transmission. This process is very simple. On the other end of the spectrum, there is the idea that a solid connector design requires a deep understanding of electromagnetic theory, a wisdom only sorcerers and wizards possess.
